

While managing **Pain & Fever**
when **Safety** is concern

Paraglee™ IV

INFUSION

Paracetamol Infusion IP 1.0%

- IV paracetamol provides around four hours of effective analgesia to patients with acute postoperative pain.
- The IV formulation of paracetamol was associated with similar analgesic properties & early recovery to that of iv tramadol after adenotonsillectomy in children.
- IV paracetamol 1g is clinically equivalent to IV dipyrone 1g for postoperative analgesia after surgery for breast cancer.
- In total abdominal hysterectomy, pre-emptive IV paracetamol 1g provided good quality postoperative analgesia, with decreased consumption of morphine and minimal side effects.
